

BIG news for large gaps

– TePe presents a new interdental brush size

The original range of TePe Interdental Brushes now comprises nine sizes, developed to fit narrow as well as wider interdental spaces. The colour of the biggest newcomer is black.

The latest addition to the colour coded assortment of TePe Interdental Brushes is also the biggest one in the range: a black brush with a wire size of 1.5 mm. The new brush has several areas of use, e.g. for patients with periodontitis, implants or missing teeth.

– In cases of severe periodontitis, we often see enlarged interproximal spaces that need thorough cleaning to inhibit further progress of the disease, says Lotta Settergren, dental hygienist at Implantatgruppen in Karlstad, Sweden. A bigger interdental brush can be of great help when the grey 1.3 mm brush simply isn't enough. The black brush is also suitable for implant patients with wide interimplant spaces and for patients with missing teeth, Lotta Settergren continues.

TePe Interdental Brushes are developed in collaboration with dental expertise. Specially selected filaments ensure efficient cleaning and durability. The unique handle is the result of a comprehensive research programme and provides a comfortable and firm grip to facilitate use. All sizes have plastic coated wire for gentle and safe cleaning around implants.
